"Antibiotic Properties of Poppy Flowers," A. F. Kapustinskiy

"Priroda" No 7, p 68

The Lab of the Zonal Ste, VIAR (All-Union Inst of Medicinal and Essential Oil-Bearing Plants) at Przhnevsk discovered that flowers of several subspcies of the opium poppy contain antibiotics. These antibiotics are effective against Micrococcus luteus, Mycobacterium citreum, and fungi which produce plant diseases. The active varieties of poppy are completely resistant to fungi and are pigmented due to a content of anthocyanins. G. F. Gavze's litmocidin is also derived from

219713

a plant containing pigments of this type. The pigment group of litmocidin is of the anthocyanin type and is actually a deriv of anthocyanidin. The therapeutic effect of poppy flower extracts will be investigated.

TITLE: Study of the Flow of Glass in Electric Furnaces for Glass
Fiber Production

PERIODICAL: Steklo i keramika, 1960, No. 8, pp. 4 - 7

TEXT: The present paper is a first attempt to study the flow of glass in small electric furnaces for glass fiber production. Besides glass pellets dyed with cobalt oxide to investigate flows in glass crucibles, the authors used radioisotopes as indicators. The experiments were carried out in an industrial plant for glass fiber production. The glass crucible was fed with glass pellets of known chemical composition. The pellets weighed 9 - 10 g each, and part of them were tagged by radioisotopes. The moment of feeding with tagged pellets and the instant of appearance of radioactivity in the glass fiber were fixed in the investigation. Besides, ✓

Card 1/3

the authors studied the distribution of activity by the groups of spinnerets, and its change with time. The glass fibers were wound on a spool. The spool axis formed an angle of $35 - 45^\circ$ with the front of spinnerets. The activity of samples was measured on a Б-2 (B-2) plant by means of АС-1 (AS-1) and БФЛ (BFL) counters. Uranium oxide and

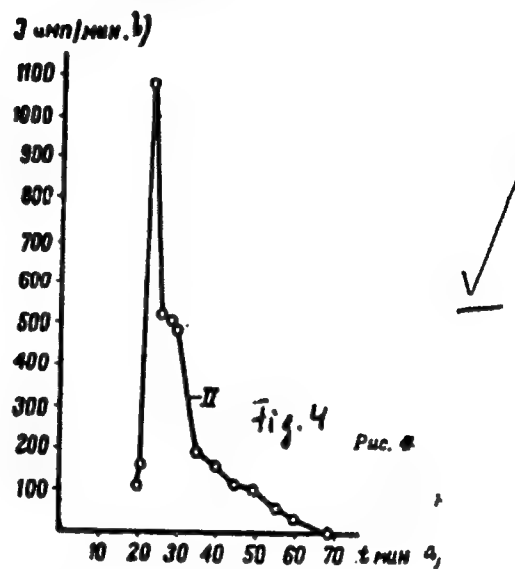

Ca^{45} were used as indicators. Fig. 4 shows experimental results obtained with a pellet activated by UO_2 . Further experiments were made with

Ca^{45} since the great difference between the atomic weights of uranium and the glass elements became clearly noticeable in feeding with several pellets. The experiments, integrated by data of temperature distribution in the glass crucible, permit a probable diagram to be plotted for the flow of glass. Temperature distribution measurements were made under the supervision of L. G. Zhivov, Candidate of Technical Sciences. There are 7 figures and 1 Soviet reference.

SOV/107-59-5-17/51

AUTHOR: Kapuston, I. (Yakutsk)

TITLE: An Electronic Key Composed of Cold-Cathode Tubes

PERIODICAL: Radio, 1959, Nr 5, p 15 (USSR)

ABSTRACT: Recently, automatic electronic keys found a wide-spread application with Soviet radio amateurs. Great power consumption and complicated construction are the most essential deficiencies of these keys. For this reason the author describes a more economical electronic key composed of tubes SG-3S or cold cathode thyratrons of type MTKh-90. This key is based on a multivibrator with two SG-3S tubes. Figure 1 shows the circuit diagram of a key with three SG-3S tubes. Two D2Ye diodes limit all pulses to a maximum level of 30 volts. One polarized RP-4 relay is used with a working current of 0.5 milliamps. The author suggests the application of two RP-4 relays, since then the duration of the last dash will not

Card 1/2

An Electronic Key Composed of Cold-Cathode Tubes

SOV/107-59-5-17/51

depend on the time during which the key contacts are closed. The key composed of three MTKh-90 thyratrons, two D2Ye diodes, is shown in Figure 3. This key works with an anode voltage of 180-300 volts and requires less than 1 milliamp current. There are 3 circuit diagrams.

TITLE: Concerning Chemical Stability and Hydrolytic Decomposition of Diborides of Some Transition Metals in Reaction With Acids

PERIODICAL: Zhurnal prikladnoy khimii, 1960, Vol 33, Nr 3, pp 569-577 (USSR)

ABSTRACT: Borides of Zr, Ti, and Cr in powder form and sintered at $1,800^{\circ}\text{C}$ under 10 atm in graphite molds were investigated with respect to their chemical stability in concentrated and aqueous sulfuric, nitric, hydrofluoric, and hydrochloric acid. Sintered TiB_2 and MoSi_2 were highly stable in HCl (d. 1.19) and H_2SO_4 (d. 1.84) at room temperature, and can be recommended as acid-resistant materials. Addition of metallic Si to TiB_2 and ZrB_2 lowered the chemical stability of

Card 1/4

Concerning Chemical Stability and Hydrolytic
Decomposition of Diborides of Some Transition
Metals in Reaction With Acids

78210

SOV/80-33-3-11/47

the borides in HCl , H_2SO_4 , and HNO_3 . The diborides evolved boron hydrides (di- and tetraborane) and hydrogen on decomposition with HCl . ZrB_2 in HCl gave a solution of ZrOCl_2 ; TiB_2 and CrB_2 gave, respectively, TiCl_3 and CrCl_3 solutions. The rate of dissolution was highest in CrB_2 and lowest in TiBr_2 . The rate of dissolution depended also on the method of preparation of the diborides; ZrB_2 obtained by the electrolytic method was more stable than that prepared by the reduction of metal oxide with boron carbide under vacuum. The hydrolysis of tetravalent borides of metals, assuming that it proceeds to boric acid, can be expressed by (1) $\text{MeB}_2 + 7\text{H}_2\text{O} \rightarrow \text{Me}(\text{OH})_4 + \text{B}_2\text{O}_3 + 5\text{H}_2$; that of trivalent borides of metals (2) $\text{MeB}_2 + 6\text{H}_2\text{O} \rightarrow \text{Me}(\text{OH})_3 + \text{B}_2\text{O}_3 + 4.5\text{H}_2$; that of

Card 2/4

SOV/80-33-3-11/47

bivalent borides of metals (3) $\text{MeB}_2 + 5\text{H}_2\text{O} \rightarrow \text{Me(OH)}_2 +$
 $+ \text{B}_2\text{O}_3 + 4\text{H}_2\text{O}$. If boron suboxides (e.g., B_2O_2) are
partially formed during the hydrolysis, then the amount
of hydrogen evolved must decrease correspondingly, and
reaction (1) is replaced by (4) $\text{MeB}_2 + 6\text{H}_2\text{O} \rightarrow \text{Me(OH)}_4 +$
 $+ 2\text{BO} + 4\text{H}_2$; and reaction (3) by (5) $\text{MeB}_2 + 5\text{H}_2\text{O} \rightarrow \text{Me(OH)}_3$
 $+ 2\text{BO} + 3.5\text{H}_2$. From the amount of hydrogen evolved and
the valence of salts formed on hydrolysis, it can be
assumed that ZrB_2 hydrolyzes according to reaction (4),
and CrB_2 , according to reaction (5). The amount of
hydrogen evolved in the hydrolysis of TiB is considerably
lower than in any of the above reactions, although the
reason for this fact is not clear as yet. There are 8
tables; and 31 references, 11 U.S., 1 U.K., 2 French,
3 German, and 14 Soviet. The 5 most recent U.S. and U.K.
references are: J. Campbell, High-Temperature Technology,

Title : Concerning the application of the haptene reaction for the diagnosis of bacterial dysentery

Periodical : Zhur. mikro. epid. i immun. No 2, 59-64, Feb 1955

Abstract : Because of the unspecific character of the haptene reaction, a high percentage of positive reactions was obtained on healthy subjects. For that reason, the authors do not recommend the haptene reaction for the diagnosis of dysentery. Three tables.

TITLE: Investigation of complex formation in the tellurium (IV)--diantipyrylmethane--bromide system

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 30, no. 1, 9-12

TOPIC TAGS: tellurium diantipyrylmethane complex, extraction, formation, diantipyrylmethane complex, tellurium selenium separation, tetravalent tellurium complex

ABSTRACT: Physical chemical analysis and analysis of the reaction product formed in the tellurium (IV)-diantipyrylmethane-bromide system established that the ratio of the reacting components (Te^{4+}) : (Diant) : (Br^-) is 1:2:6. The solubility of the (Diant)₂(TeBe₆) complex is 1.12 g./l. in dichlorethane. The optimum conditions for extracting the tellurium complex with dichlorethane include a sufficiently large excess of halide and 6 N acidity in the

Change of the electrical resistance of the Fe₃Pt alloy in a longitudinal magnetic field. R. G. Annaev, V. G. Dubrovskii, and E. K. Kapustyan. *Int. Phys. & Geophys. Acad. Sci. Turkmen S.S.R., Ashkhabad, Doklady Akad. Nauk S.S.S.R.* 82, 549-52 (1953).—The longitudinal galvanomagnetic effect $\Delta R/R$ of the alloy Fe₃Pt was studied for different thermal treatments. The samples were kept in vacuum at 1000° for 1 hr., then quenched in water, then annealed step-by-step at 800, 775, 750, 700, 600°; they were kept 10 hrs. at each temp., then quenched in water. $\Delta R/R$ decreased by a factor of 2 when the annealing temp. was decreased from 800 to 600°. The magnetization I and the sp. elec. resistance ρ also decreased. The quadratic law $\Delta R/R = cI^2$ was satisfied; there was a discontinuity in the slope of the curve at the 1st point of anisotropy (855 gauss) for the sample kept at 1000° and then quenched in water; the discontinuity disappeared after subsequent annealing, which indicated that internal stresses arose in the sample in proportion to the increase in the amt. of the ordered phase. The results were in good agreement with Akulov's theory of even effects. —H. Dunlap

TITLE: Durability of **Mass-produced** Hatches of Railway Gondola Cars While
Loading Under Pressure (Prochnost' seriynykh kryshek lyukov
zheleznodorozhnykh poluvagonov pri udarnoy nagruzke)

PERIODICAL: Avtomaticheskaya svarka, 1958, Nr 8, pp 46-59 (USSR)

ABSTRACT: The existing hatches of gondola cars in the USSR are unsatisfactory and cause considerable losses of coal in railroad transport. Hatches of 60- and 93-ton cars produced by Uralvagonzavod and the Kryukov Car Building Plant were experimentally tested and deficiencies of their design were revealed. As a result of the experiments, new hatch designs were developed. Several variations are suggested composed of bent, thin-walled profiles. The proposed hatches are rigid, lighter, and more durable than the hatches presently in use. There are 6 diagrams, 5 graphs, 2 tables and 2 Soviet references.

TITLE: One-parametric solution of laminar boundary-layer equations in a high-velocity gas flow with Prandtl number not equal to one

SOURCE: Leningrad. Politekhnikheskiy institut. Trudy, no. 265, 1966. Gidrogazodinamika (Hydraulic and gas dynamics), 24-34

TOPIC TAGS: supersonic aerodynamics, supersonic ~~gas~~ flow, ~~skin~~ friction coefficient, aerodynamic heat transfer, laminar boundary layer, enthalpy, ~~flow separation~~, ~~computer calculation~~, ~~heat transfer coefficient~~, gas flow, parametric equation

ABSTRACT:

An attempt is made to analyze the domain of applicability of the parametric method to solving laminar boundary-layer equations. A parametric method is outlined for solving a system of universal equations of the laminar-boundary layer derived previously by the author. The solution is sought by integrating the system with derivatives of χ -(compression parameter) neglected. The results of computations made on a BESM Computer at the Leningrad University Computing Center of the AN SSSR by the method of nets are presented in graphs and tables for the case of high velocity gas flows with Prandtl number $\sigma = 0.72$ and enthalpy at the surface $S_w = -0.4; 0; 0.4$ and with χ

Card 1/2

UDC: none

ACC NR: AT7005298

varying from 0 to 0.95. Moreover, the solution is also presented in the form of a series in powers of form parameters $f_k = U_e^{k-1} U_e^{(k)} Z^{**}$ ($K = 1, 2, \dots$) with $S_w = -0.4$, $\sigma = 0.72$; $\chi = 0.5$. The effects of χ and σ on the friction parameter ζ and the heat transfer coefficient ζ^* are evaluated and discussed. An example of calculating the boundary layer in the case of high-velocity gas flows over a surface given by $y = -2 \log [\cosine(0.5x)]$ by the present method and that of C. Cohen and E. Reshotko is presented for $T_w = 1045^\circ$; $M_\infty = 3.606$; 5; and $T_w = 1465^\circ$; $M_\infty = 3.606$; 4.5; 6.08 with a free-flow temperature of 290° . The values of $C_f/\sqrt{R_{wx}}$ and $N_{wx}/\sqrt{R_{wx}}$ versus x for various values of T_w and M_∞ calculated by both methods are plotted and compared. The effects of M_∞ on skin friction and of M_∞ and T_w on separation are evaluated; it is shown that the error in determining the point of separation by Cohen-Reshotko method increases with M_∞ . Orig. art. has: 5 figures, 10 formulas, and 4 tables. [AB]

Card 2/3

L 23060-66

ACC NR: AP6002000

Currently, work is underway on the approximate integration (one-parameter approximation) of universal equations of the laminar boundary layer in a flow of a homogeneous gas with $Pr = 0.72$. However, the calculations already performed for $Pr = 1$ are of some importance, since it has been shown that the influence of the Prandtl number on the dynamic characteristics of the boundary layer is extremely insignificant. The one-parameter method of calculation of the boundary layer is compared to the Cohen-Reshotko method (Cohen, C. B., Reshotko, E. NACA, 1294, 2-10, 1956) and it is concluded that the Cohen-Reshotko method yields satisfactory results only in certain cases. As an example, a calculation is performed and shows that the use of the Cohen-Reshotko method produces results which underestimate friction in the diffusion region of the boundary layer and to a premature discontinuity of the layer. Orig. art. has: 5 figures and 7 formulas.

TITLE: Ultrasonic methods for investigating fatigue of materials

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 4, 1961, 16, abstract 4 E124 (Tr. Krasnoyarskogo s-kh in-ta, 1959, v. 3, no. 1, 301-310)

TEXT: A method for investigating fatigue with the aid of large amplitude waves is described and preliminary results are reported. It proved possible to obtain amplitudes up to 0.08 mm with the aid of an exponential horn (amplification $K = 25$) and a nickel transducer at 20 kc/s. The block diagram of the generator with independent excitation (up to 450 watts) is given, construction of the junction of the transducer, and the temperature, amplitude and method of coupling the sample with the latter is demonstrated. Samples of thickness 0.3 - 0.5 and length 50 - 100 mm are subjected to fatigue

"Study of the Distribution and Excretional Relations of 5-Ethyl-5-Isoamyl-Barbiturate-6- ^{14}C (Dorlotyn)."

Budapest, Kiserletes Orvostudomány, Vol XVIII, No 2, Apr 66, pages 163-168.

Abstract: [Authors' Hungarian summary modified] The distribution of Dorlotyn and Amytal (henceforth either: D) and their excretion in the body fluids was studied in dogs and rats as well as in cases of human poisoning. Labelled D (Dx) and Na-isoamyl-ethyl-barbituricum (NaDx) were used for the experiments. The possibilities of direct extraction with chloroform from the individual organs were also studied. In the course of the experiments, it was established that D is very rapidly decomposed in the organism and its decomposition products are mostly found in the urine. Since the decomposition products will give no, or only an uncertain Zwicker-Bodendorf reaction, paper chromatographic tests must also be carried out in cases of poisoning since the decomposition products have known Rf values. Decomposition products of D were determined successfully in human urine samples as well by means of the paper chromatographic test. The aim of further experiments will be to study the changes in D level as a function of time in the various body fluids. All 8 references are Western.

TITLE: Radiographic investigation of the surface layers of 9Kh steel that were hardened by high-temperature thermomechanical surface treatment

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no 4, 1966, pp 10-14

TOPIC TAGS: chromium steel, surface hardening, metal heat treatment, x ray analysis/9Kh chromium steel

ABSTRACT: This is a continuation of a previous investigation (Bernshteyn, M. L., Belkin, M. Ya., Venzhega, A. S., Kalyagina, G. P., Ryabova, L. A. Vestnik mashinostroyeniya, 1965, no. 6; Bernshteyn, M. L. MITOM, 1965, no. 7) with the difference that the relationship between hardness and the increase in resistance to contact fatigue of the surface layer of specimens taken from the rolls of cold-rolling mills following their high-temperature thermomechanical surface treatment (HTTST) is investigated by means of radiographic analysis of the width of the (110)_α line over the depth of the layer as a function of conditions of HTTST.

Card 1/3

L 33559-66

ACC NR: AP6012232

Findings: HTTST causes marked changes in the fine structure of the material, as manifested in the increase in lattice energy (broadening of the width of x-ray lines). Thus, following various regimes of HTTST and induction hardening, with all the specimens subjected to final tempering at 160-180°C for 90 min (Fig. 1), it can

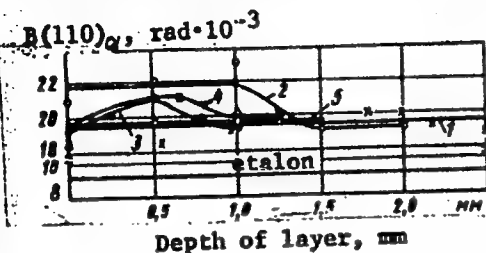

Fig. 1. Change in the width of the x-ray interference line (110)_α over the depth of the layer as a function of rolling pressure during HTTST (tempering at 160-180°C):

1 - induction hardening; 2-5 - HTTST; 2 - p = 65 kg; 3 - p = 45 kg; 4 - p = 55 kg; 5 - p = 75 kg

be seen that the optimal HTTST regime causes the strongest change in line width; it is only at a depth of ~1 mm that line width begins to decrease. Further, a comparison of the C content before and after HTTST with degree of deformation $\epsilon = 50\%$ showed that the total C content of the solid solution following HTTST is markedly lower (0.61%) than following conventional hardening. This confirms a previous observation by Gulyayev (Gulyayev, A. P., Shigarev, A. S. MITOM, 1963, no. 4). The

Title : On the Composition and Chemical Properties of Magnesium Borides

Orig Pub: Zh. Obshch. Khimii, 1955, Vol 25, No 3, 433-444

Abstract: It has been established by x-ray and chemical analysis that Mg and B begin to react at $720 \pm 20^\circ$. At temperatures up to 800° , MgB_2 (I) is formed regardless of the Mg/B ratio. At higher temperatures I decomposes, forming one of three other boride compounds, depending on the temperature; the same compounds are also formed in Mg-B mixtures of varying composition at the same temperatures. I is a dark brown powder which is slowly decomposed by water and more vigorously by acids. When I is treated with hot concentrated HCl, boranes are evolved (0.8-1.1% of the total B content) as well as 2.11-2.12 moles H_2 per mole I. The boride I crystallizes in a hexagonal lattice (of the AlB_2 type); the space-group is D_{6h} , a 3.085, c 3.519 A.U.

Title : Composition and structure of magnesium borides

Periodical : Dok. AN SSSR 100/6, 1095-1098, Feb 21, 1955

Abstract : Data are presented regarding magnesium borides synthesized from elements in an atmosphere of purified electrolytic hydrogen. Magnesium borides appear in the form of a dark-brown powder which decomposes (partially) during continuous heating with HCl. H_2O_2 , slowly and gradually oxidizes the powder but to a lesser extent than nitric acid. The physico-chemical properties of magnesium borides are described. TITLE:

On the Interaction of Elementary Boron and Some Borides With Potassium Periodate and Potassium Iodate (O vzaimodeystvii elementarnogo bora i nekotorykh boridov s peryodatom i yodatom kaliya)

PERIODICAL:

Zhurnal Neorganicheskoy Khimii, 1958, Vol. 3, Nr 2, pp. 328-332 (USSR)

ABSTRACT:

Investigations of the oxidation of boron and some borides with potassium periodate and potassium iodate in acid solutions were performed. The signal for the reaction of borides and potassium periodate is the entrance of elementary boron into the reaction. Elementary boron and the borides of magnesium, beryllium, calcium, barium and manganese are dissolved in acid solutions of potassium periodate and potassium iodate. The borides of chromium, titanium, zirconium and aluminum as well as boron carbide and boron nitride do not decompose in acid solutions with potassium iodide and potassium iodate. This can be analytically used for the separation of the above-mentioned borides of boron. The determination of boron in the initial substances is performed by the alkali meltings. The

Card 1/2

- On the Interaction of Elementary Boron and Some Borides With Potassium Periodate and Potassium Iodate 78-2-12/43

influence of potassium periodate upon amorphous boron shows that the oxidation of boron takes place according to the following reaction: $3 \text{KJO}_4 + 2 \text{B} \rightarrow 3 \text{KJO}_3 + \text{B}_2\text{O}_3$. The oxidation of boron with potassium iodate takes place according to the following reaction: $\text{KJO}_3 + 2 \text{B} \rightarrow \text{B}_2\text{O}_3 + \text{KJ}$. The obtained results can be utilized for the conversion of elementary boron and some borides in a solution for analytical purposes as well as for the separation of mixtures of boron and borides which are difficult to dissolve. There are 4 tables and 7 references.

TITLE: Periodate and Iodate Methods for the Analysis of Elementary Boron and of Borides (Periodatnyy i iodatnyy metody analiza elementarnogo bora i boridov)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 9, pp 1065-1066 (USSR)

ABSTRACT: The test results obtained in the study of the interaction of elementary boron and of borides with acid solutions of potassium periodate and iodate have facilitated the development of new, accelerated methods using the method of Shtok-Dzhons (Ref 2). For the dissolution of boron or borides, both periodate and iodate can be used. With the latter, the oxidation occurs more slowly. The present method can be employed for the boron determination in elementary boron and in the borides of a number of metals. With regard to speed and selectivity, this method has several advantages over the other methods described in the literature. From the analytical procedure specified it is apparent, amongst others, that the oxidation is effected with a KJO_4 (or KJO_3) solution (acidified with HNO_3 or HCl) and by means of boiling in a reflux condenser. Excessive KJO_4 and KJO_3

Periodate and Iodate Methods for the Analysis of Elementary Boron and of Borides

are removed with KJ, and the iodine separated out is titrated with a 0,1 n thiosulfate solution. For the KJO_3 content determination, the method of Myuller and Fridberger (Ref 7) can be employed instead of that of Shtok-Dzhons. There are 2 tables and 7 references, 2 of which are Soviet.
